

Detailed Django Live Website Deployment Guide (PythonAnywhere + GitHub)

STEP 1 — OPEN YOUR DJANGO PROJECT

First open the folder where your Django project is stored.

Example:

```
Desktop
└─ BatchProject
```

Your project folder should contain:

```
manage.py
BatchProject/
  userapp/
  AdminApp/
  templates/
  static/
  media/
```

STEP 2 — OPEN PROJECT IN VS CODE

Method

1. Open Visual Studio Code.
2. Click:

```
File → Open Folder
```

1. Select your Django project folder.
2. Click:

```
Select Folder
```

Now your project will open in VS Code.

STEP 3 — CHANGE DEBUG SETTINGS

Open:

```
settings.py
```

Usually path:

```
BatchProject/BatchProject/settings.py
```

Find:

```
DEBUG = True
```

Change it to:

```
DEBUG = False
```

Why?

When website goes live:

- Debug mode should be OFF
- Errors should not display publicly
- Better security

STEP 4 — ADD ALLOWED_HOSTS

Find:

```
ALLOWED_HOSTS = []
```

Change to:

```
ALLOWED_HOSTS = ['*']
```

OR if you have domain:

```
ALLOWED_HOSTS = [ 'abc.com' ]
```

Explanation

This tells Django:

"Which domains are allowed to open this website"

For learning purpose use:

```
[ '*' ]
```

STEP 5 — RUN SERVER CHECK

Open terminal in VS Code.

Run:

```
python manage.py runserver
```

If project starts successfully:

```
Starting development server at http://127.0.0.1:8000/
```

then everything is working.

Open browser:

```
http://127.0.0.1:8000/
```

Check:

- Home page
 - Login
 - Registration
 - Images
 - CSS
 - Database
-

STEP 6 — CREATE requirements.txt FILE

Open NEW terminal.

Run:

```
pip freeze > requirements.txt
```

What this does?

This stores all installed Python packages.

Example:

```
Django==5.2  
Pillow==10.0  
mysqlclient==2.2  
requests==2.31
```

A new file will appear:

```
requirements.txt
```

IMPORTANT:

Do not delete this file.

STEP 7 — UPLOAD PROJECT TO GITHUB

Create GitHub Account

Open:

```
https://github.com
```

Sign in.

Create New Repository

Click:

New Repository

Repository name example:

BatchProject

Select:

• Public OR Private

Click:

Create Repository

Open Git Bash

Go to project folder.

Right click:

Open Git Bash Here

Initialize Git

Run:

```
git init
```

Add Files

Run:

```
git add .
```

Commit Files

Run:

```
git commit -m "first commit"
```

Change Branch to master

Run:

```
git branch -M master
```

Connect GitHub Repository

Copy repository URL.

Example:

```
https://github.com/username/BatchProject.git
```

Run:

```
git remote add origin https://github.com/username/BatchProject.git
```

Push Project to GitHub

Run:

```
git push -u origin master
```

Now project uploaded successfully.

STEP 8 — CREATE PYTHONANYWHERE ACCOUNT

Open:

`https://www.pythonanywhere.com`

Click:

Pricing & Signup

Choose:

Beginner Plan

Create account.

Example:

Username: noteApp26
Email: your email
Password: your password

Click:

Create Account

STEP 9 — VERIFY EMAIL

Open Gmail.

Find verification mail from PythonAnywhere.

Click verification link.

Account verified successfully.

STEP 10 — OPEN DASHBOARD

Login PythonAnywhere.

You will see dashboard.

Tabs:

```
Files
Web
Consoles
Tasks
Databases
```

STEP 11 — SEARCH STUDYGYAN GUIDE

Search in Google:

```
host django website studygyan
```

Open StudyGyan deployment article.

Follow deployment process.

STEP 12 — OPEN BASH CONSOLE

In PythonAnywhere:

Click:

```
Consoles
```

Open:

```
Bash Console
```

STEP 13 — CREATE VIRTUAL ENVIRONMENT

Run:

```
mkvirtualenv --python=/usr/bin/python3.10 myenv
```

Explanation

- myenv = virtual environment name
- python3.10 = Python version

Environment created.

STEP 14 — CREATE CLEAN REPOSITORY

Sometimes old repository causes issues.

Create another clean repository if needed.

STEP 15 — COPY PROJECT TO NEW LOCATION

Create clean folder.

Example:

LiveProject

Copy project there.

IMPORTANT:

Delete old:

.git

folder if exists.

STEP 16 — OPEN GITBASH

Inside clean project folder:

Right click:

Git Bash Here

STEP 17 — USE GIT COMMANDS

Run again:

```
git init
git add .
git commit -m "live deployment"
git branch -M master
```

STEP 18 — PUSH TO GITHUB

Run:

```
git remote add origin YOUR_REPO_URL
```

Then:

```
git push -u origin master
```

STEP 19 — OPEN PYTHONANYWHERE BASH

Inside PythonAnywhere Bash Console.

STEP 20 — CLONE GITHUB PROJECT

Run:

```
git clone YOUR_GITHUB_REPOSITORY_URL
```

Example:

```
git clone https://github.com/username/BatchProject.git
```

Project downloaded.

STEP 21 — CHECK FILES

Run:

```
ls
```

This shows folders/files.

STEP 22 — OPEN PROJECT DIRECTORY

Run:

```
cd BatchProject
```

Use TAB for autocomplete.

Now you entered project folder.

STEP 23 — INSTALL REQUIREMENTS

Activate environment:

```
workon myenv
```

Install packages:

```
pip install -r requirements.txt
```

All dependencies installed.

STEP 24 — SKIP STEP 6

If StudyGyan says optional step.

Skip it.

STEP 25 — CREATE WEB APP

Go to:

Web Tab

Click:

Add a new web app

Select:

Manual Configuration

Select:

Python 3.10

Web app created.

STEP 26 — FIND PROJECT PATH

Go to:

Files Tab

Open project folder.

Copy full path.

Example:

/home/noteApp26/BatchProject

STEP 27 — SET SOURCE CODE AND WORKING DIRECTORY

In Web Tab:

Find:

```
Source code  
Working directory
```

Paste:

```
/home/noteApp26/BatchProject
```

in both.

STEP 28 — SET VIRTUALENV PATH

Find virtualenv path.

Example:

```
/home/noteApp26/.virtualenvs/myenv
```

Paste in:

```
Virtualenv
```

section.

STEP 29 — STATIC AND MEDIA FILES

Add static path.

Example:

```
URL: /static/  
Directory: /home/noteApp26/BatchProject/static
```

Add media path.

Example:

```
URL: /media/  
Directory: /home/noteApp26/BatchProject/media
```

Explanation

STATIC:

- CSS
- JavaScript
- Icons

MEDIA:

- Images
- PDFs
- Uploaded files

STEP 30 — EDIT WSGI FILE

In Web Tab:

Open WSGI configuration file.

Find:

```
mysite.settings
```

Replace:

```
BatchProject.settings
```

Use your actual project name.

You can check project name from:

```
wsgi.py
```

inside project.

STEP 31 — RELOAD WEBSITE

Go back to Web Tab.

Click:

Reload

Wait few seconds.

Website deployed.

STEP 32 — OPEN LIVE WEBSITE

PythonAnywhere gives URL.

Example:

`https://noteApp26.pythonanywhere.com`

Open in browser.

Check:

- Login
 - Registration
 - CSS
 - Images
 - Uploads
 - Admin panel
-

STEP 33 — CHECK MEDIA FILES

All uploaded files appear inside:

`media/`

Examples:

- Notes PDFs
- Profile Images
- Documents

EXTRA TOPICS

GODADDY

GoDaddy is:

- Domain provider
- Hosting provider

Used for:

- Buy domain
- Business email
- Hosting

HOSTINGER

Hostinger provides:

- Shared hosting
- VPS hosting
- Domain hosting

DEVOPS

DevOps means:

Development + Operations

Used for:

- Deployment
- Automation
- Server handling
- Monitoring

DOCKER

Docker is container technology.

Used for:

- Same environment everywhere
 - Easy deployment
 - Portable applications
-

CI/CD

CI = Continuous Integration

CD = Continuous Deployment

Used for:

- Automatic testing
 - Automatic deployment
 - Faster workflow
-

FINAL IMPORTANT COMMANDS

Run Server:

```
python manage.py runserver
```

Create Requirements:

```
pip freeze > requirements.txt
```

Install Requirements:

```
pip install -r requirements.txt
```

Git Initialize:

```
git init
```

Git Add:

```
git add .
```

Git Commit:

```
git commit -m "message"
```

Push Project:

```
git push -u origin master
```

Clone Project:

```
git clone REPOSITORY_URL
```

Create Virtual Environment:

```
mkvirtualenv --python=/usr/bin/python3.10 myenv
```

Activate Environment:

```
workon myenv
```

DEPLOYMENT COMPLETED SUCCESSFULLY
